EXPERIMENT 7: ZOHO CREATOR API INTEGRATION

Library Book Issue Management System — External API Data Fetching

AIM

To configure and integrate an external REST API with Zoho Creator using Deluge scripting, enabling automated retrieval of book details (such as Book Title) based on user-entered ISBN values in the Library Book Issue Management System.

PROCEDURE

1. Navigate to the **Workflows** section of the *Book_Catalog* form and create a new Field Event rule triggered on *User input of ISBN* upon creation or edit.
2. Configure the Deluge script action to invoke the Open Library REST API endpoint via `invokeurl`, parsing the returned JSON response to extract book metadata.

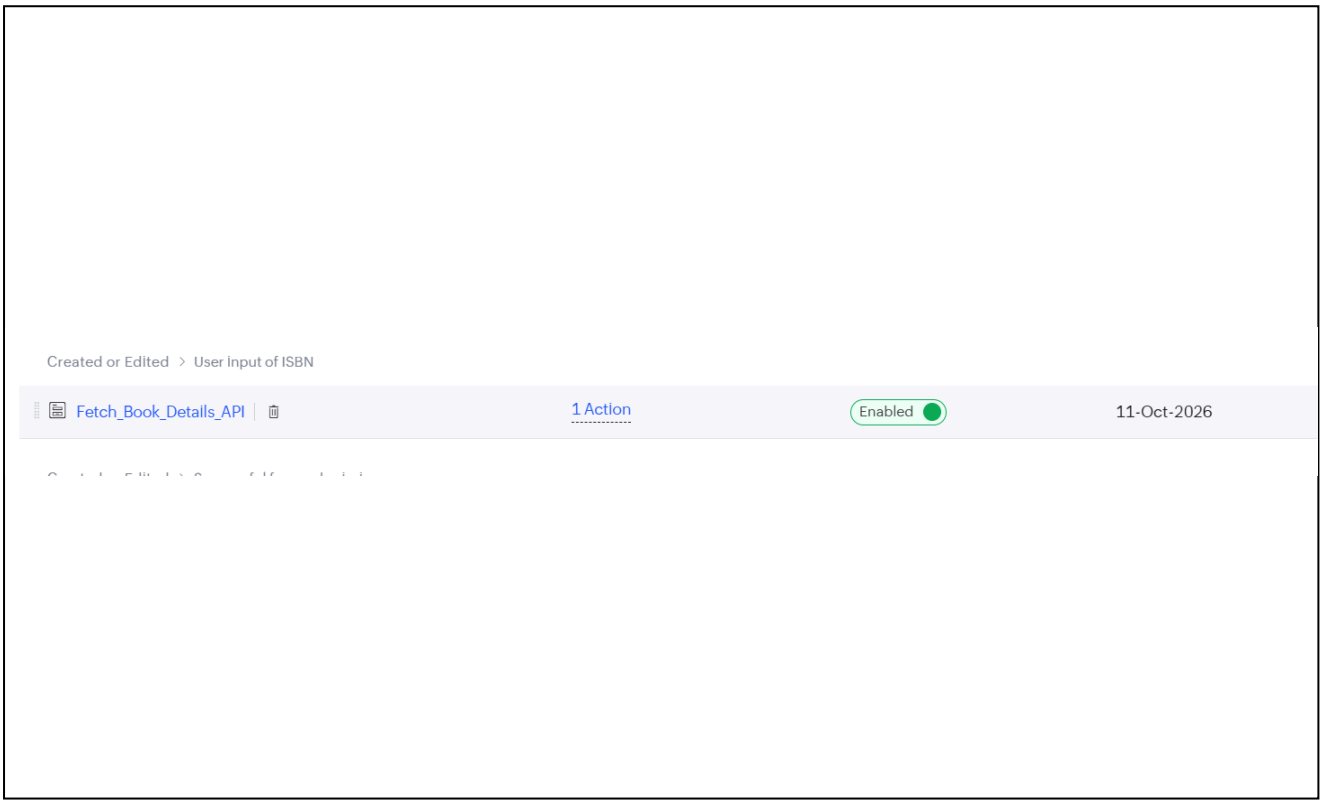

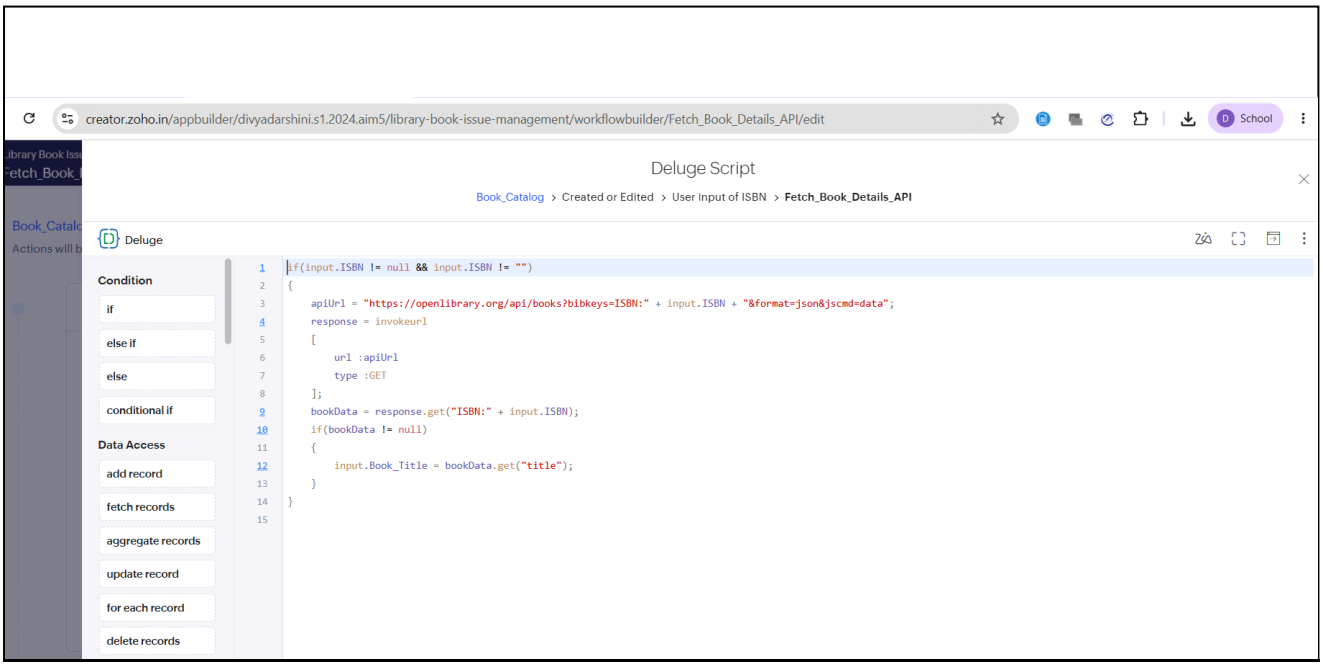

Figure 7.1: Workflow rule setup (Fetch_Book_Details_API) configured on ISBN field input.

3. Access the live **Book_Catalog** form and enter a valid ISBN number (e.g., 0415291305) into the designated field.

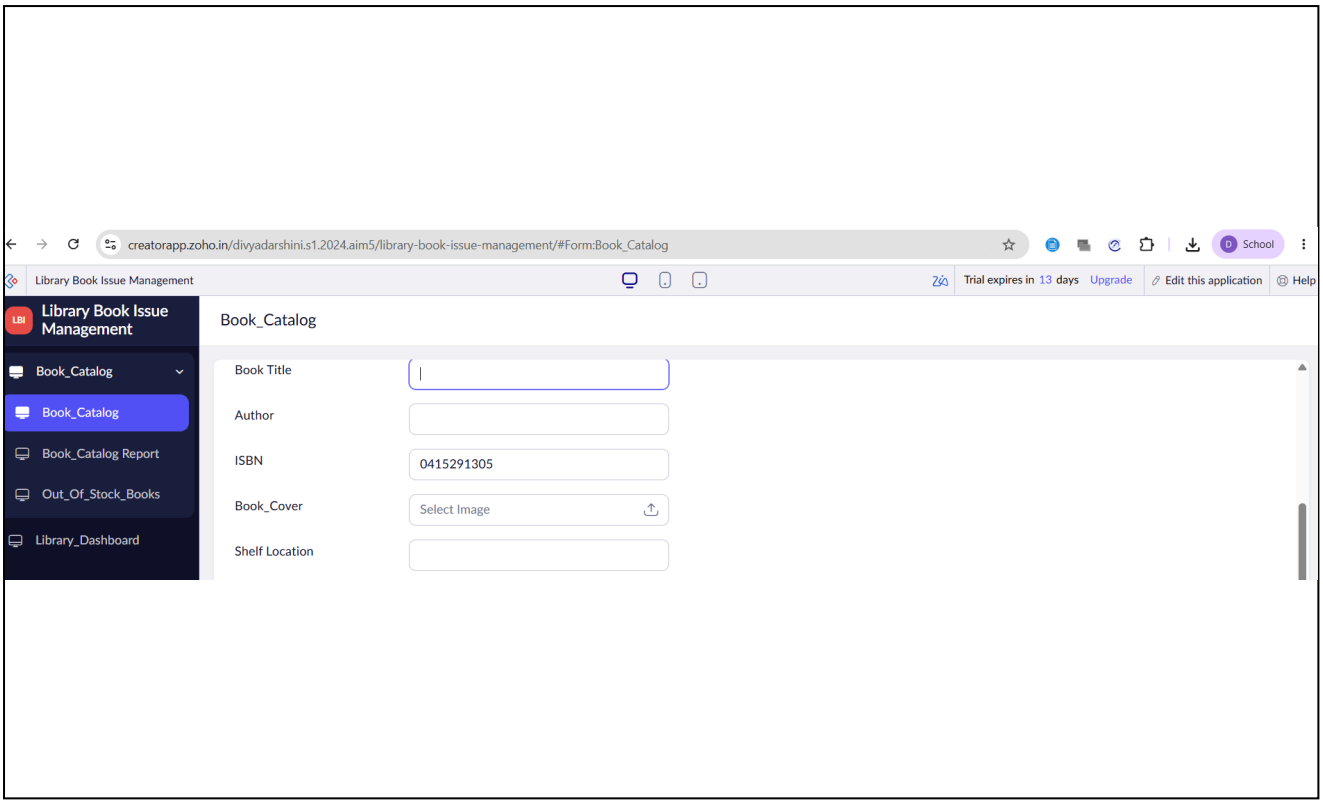

Figure 7.3: User entering ISBN number (0415291305) into the live Book Catalog form.

4. Verify that upon field change, the external API request is triggered automatically and populates the Book Title field with the retrieved value ("Fantasy").

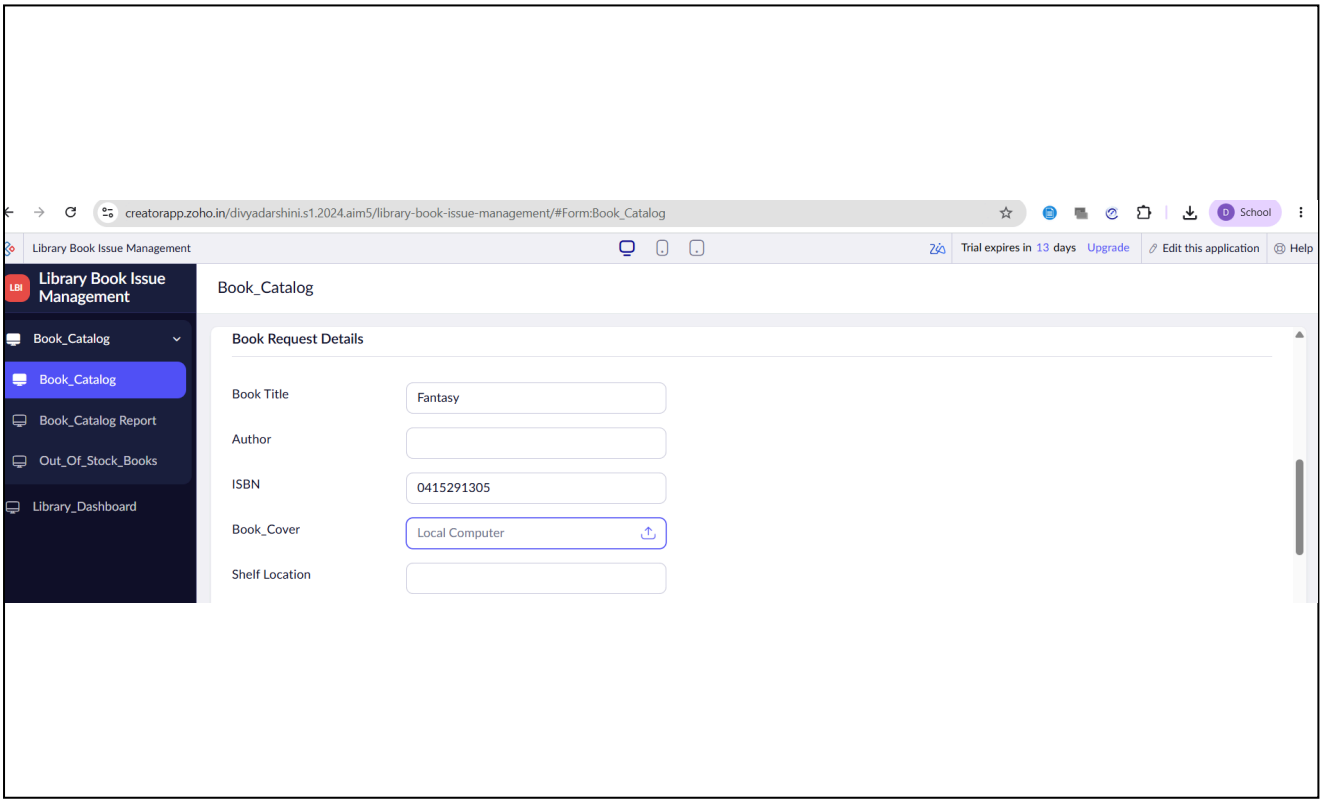

Figure 7.4: Live form automatically populating the Book Title ("Fantasy") fetched from the Open Library API.

RESULT

The external API integration using Deluge scripting was successfully configured and tested in Zoho Creator. The application dynamically fetches and populates book details from the Open Library REST API upon entering the ISBN
